    <h2 class="tit">What really is food waste?</h2>
    <section>Food waste is defined as food loss during retail and final consumption. Although the
    world produces enough food to feed everyone, millions of children still go to bed hungry every night.
    According to the latest research by the Food and Agriculture Organization (FAO), 828 million people
    are hungry in the world. We now wonder why this is happening; one of the primary reasons is food
    waste; according to the FAO, approximately 1.6 billion tons of food are wasted annually. This is a
    staggering amount of food that could have been used to feed millions of people. In this project, we
    are going to look at the effects and causes of food waste in India and how we can tackle
    them.</section>
    <p class="quote">"The only way to deal with food waste is to stop wasting food."</p>
    <h2 class="tit">Causes of Food waste in India</h2>
    <h4>    Nearly 40 percent of the food produced in India is wasted every year due to fragmented
    food systems and inefficient supply chains - a figure estimated by the Food and Agricultural
    Organisation (FAO).</h4>
    <section>
      <ul>
        <li><h4>Poor infrastructure:</h4>Lack of proper storage facilities, transportation,
        and refrigeration systems lead to spoilage and wastage of food products.</li>
        <li><h4>2. Inefficient supply chain management:</h4>Inadequate supply chain
        management results in overproduction, which leads to food waste.</li>
        <li><h4>Lack of awareness</h4>Consumers often discard food items that are edible due
        to lack of awareness about their shelf life and storage conditions.</li>
        <li><h4>Harvest and Post-Harvest Losses:</h4>A significant portion of food wastage in
        India occurs at the agricultural level. Factors such as improper harvesting techniques, inadequate
        packaging, and lack of access to markets contribute to losses of fruits, vegetables, and grains.</li>
      </ul>
